

FUTURE OF SMALL ARMS DEVELOPMENT

The only truly modular semi-auto rifle system in the world today.

THE MGI RATE AND RECOIL REDUCING BUFFER FOR M4/M16/AR15 PLATFORMS

Best in the world!!

The **MGI Rate and Recoil Reducing Buffer** for M4/M16/AR15 platforms is a simple, self-adjusting, drop-in unit that will reduce the rate of fire in your rifle without losing any reliability. In fact, the MGI Buffer, which is completely mechanical (not hydraulic like other brands) will **decrease the rate of fire and reduce recoil while increasing your accuracy potential!** The MGI Buffer works in both carbines and full-length rifles.

Testing has shown rate of fire reduction of over 300 rounds per minute. Muzzle climb is drastically reduced meaning more rounds on your target. The faster your cyclic rate is, the more reduction you will see. During our testing, an 11.5" M16 with a cyclic rate of nearly 1100 rounds per minute was tamed by our buffer to function at 754 rounds per minute. We also tested the unit in an M16 with a 20" barrel that was cycling at 771 rounds per minute. It dropped to 585 rounds per minute with this new rate reducer and almost completely eliminated muzzle rise, even under full automatic fire!

The MGI Rate & Recoil Reducing Buffer was designed to work not only in the standard M4 / M16 / AR-15 platforms, but also with MGI's Modular Weapon System (Hydra). Because of the mechanical function of the buffer, it works very well with all of the AR calibers. **The harder you push it, the harder it pushes back to counter the recoil.**

A D-fender D-Ring also comes with the MGI Buffer which will **virtually eliminate extraction problems.** Order online.
